# Mamba Vacuum Cleaner

## The best in class "H"

Dehaco's Mamba 121 H-class vacuum cleaner has been specifically designed for hazardous substances such as asbestos. The Mamba uses an H13 HEPA filter to prevent the spread of hazardous dust particles and features an audio-visual alarm system that notifies you if the vacuum cleaner becomes clogged.

In the Netherlands, construction vacuum cleaners are divided into three filter classes: L-, M- and H-class. L stands for Low, M stands for Medium and H stands for High. The vacuum cleaner class indicates how much dust is trapped by the filter in relation to the total volume of dust. An L-filter will release no more than 1% of the dust, an M-filter 0.1% and an H-filter 0.005%. H-class vacuum cleaners are ideal for cleaning up pathogenic substances such as lead, asbestos fibres, coal, cobalt, nickel, tar, copper, cadmium and fungi/bacteria.

### New: Black Mamba series

The Black Mamba 150 is equipped with one motor and has a container capacity of 50 litres.

The Black Mamba 277 is driven by two powerful motors that operate at 230 Volts. They help to ensure high suction power. The container of the Black Mamba 277 has a capacity of 77 litres.

The containers of these vacuum cleaners are made entirely of stainless steel. This makes them very easy to clean, super robust and also very durable. The vacuum cleaners are cooled using a by-pass. Furthermore, all supplied accessories are interchangeable between the two models. The same goes for the dust bag: both models have the same dust bag capacity, namely an impressive 35 litres!

Mamba vacuum cleaners have been assigned to class H. This means that the filter stops over 99.995% of all dust. H-class vacuum cleaners are suitable for vacuuming pathogenic substances, such as lead, asbestos fibres, coal, cobalt, nickel, tar, copper, cadmium and mould/bacteria.
